

SOFTWARE SERVICES

Our Software Services division provides services relating to the mechanics of insurance systems. With our Testing Services, we make sure systems are operating correctly. In our Implementation Services, we help make sure systems are documented correctly, set up appropriately, or investigate why systems aren't performing as they should. With our Software Services, we make systems work.

We don't sell our own system. Rather, we configure and customize proven solutions provided by others. You pick the system you like best. We help you get the most out of it.

HERE ARE THE SERVICES WE OFFER:

- **CONFIGURATION**

Many of today's modern policy administration systems and other insurance solutions feature robust toolsets that allow companies to configure and maintain their own systems, without the need for software developers. Our Software Services feature seasoned configuration specialists who are trained and sometimes certified to work with many of these solutions. When you couple our technical understanding of these systems with our deep insurance knowledge, the value Marias can provide is second to none.

- **CUSTOM SOFTWARE DEVELOPMENT**

Our development staff concentrates on system-to-system communication, integrations, and data extraction. We've integrated third-party portals into existing core systems, integrated third-party underwriting data connections into core systems, and created the daily data files MGAs' systems send to their parents or carriers of record. We can also program your testing-automation tools.

- **OUR APPROACH**

We can be the sole provider of your configuration and software development needs, or we can work alongside your staff and add capacity. It doesn't matter to us. Our only goal is to provide the services you need in the model that's best for your organization.

WHY MARIAS?

If you recognize the value experienced objectivity can bring to your insurance operations, call us today. You'll be surprised at how responsive a real service organization can be.
